VComply - Software Development Role
Build & Deploy Assignment

1. Overview

VComply is a B2B SaaS platform helping organizations manage Governance, Risk, and Compliance (GRC). We work with companies across healthcare, energy, finance, and other regulated industries to simplify policy management, controls tracking, and audit readiness.

As part of our campus recruitment drive, you have been shortlisted for the assignment round. This stage is designed to let you show us how you think, what you build, and how you ship .

You will have a fixed time window to ideate, build, and deploy a working product or prototype. There are no restrictions on what you build. What matters is the quality of your thinking, the clarity of your execution, and your ability to ship something real.

2. The Assignment

Problem Statement

Build and deploy a web-based tool that solves a real, specific problem for a defined user.

The problem can be anything: productivity, learning, compliance, health, finance, entertainment, developer tooling, or anything else you find genuinely interesting. You are not restricted to GRC or VComply's domain. What the goal of the assignment is:

- Does the problem actually exist and matter to someone?
- Is your solution a genuine improvement over existing alternatives?
- Did you make deliberate product decisions about scope, features, and trade-offs?

What to Build

A working product or prototype. This is not a mockup or a slide deck. It must be:

- Functional: core user flows must work end-to-end
- Deployed: hosted on a public URL that we can access without setup
- Purposeful: solving a clearly stated problem for a clearly stated user

3. Technical Requirements

You have full freedom over your technology stack. Use whatever languages, frameworks, and tools you are most comfortable with. Below are the non-negotiables:

- **The application must be accessible via a public URL at time of submission**
- **The code must be in a public GitHub (or equivalent) repository**
- **The repository must include a README (see Submission Requirements below)**

Beyond those three constraints, all choices are yours for frontend framework, backend language, database, authentication, hosting platform, etc.

Free hosting options you may find useful (no endorsement implied): Vercel, Netlify, Railway, Render, Fly.io, GitHub Pages, Supabase, PlanetScale.

4. Submission Requirements

Submit all of the following to the registered email contact from VComply: [redacted]

4.1 Deployed Application URL

A live, working link to your application. Ensure it remains accessible for at least 10 days after the submission deadline.

4.2 GitHub Repository

A link to your public code repository. The repository must include:

- README.md: project description, the problem it solves, the user it is for, setup instructions, and any known limitations
- Clean commit history: commits should reflect your actual development process
- No credentials, API keys, or secrets committed to the repository

4.3 Product Write-Up (max 400 words)

A short written document (can be part of the README or a separate file) covering:

1. What problem does your tool solve, and who is the user?
2. What were the two or three most important product decisions you made, and why?
3. What did you cut from scope, and what would you build next if you had more time?
4. What broke or surprised you during development, and how did you handle it?

4.4 Short Demo Video

A 2–3 minute screen recording walking through the key flows of your product.

5. Evaluation Criteria

Submissions will be evaluated across five dimensions. We look at the whole submission holistically, but below is how we weight each area:

Dimension	What We Look For
Product Sense	Does the tool solve a real problem? Is the goal clear and well-reasoned? Is the scope appropriate for the time available?

Dimension	What We Look For
Code Quality	Clean, readable, well-structured code. Sensible use of components, functions, and naming conventions.
Functionality	Does the product actually work end-to-end? Are the core flows complete and stable?
Testing	Evidence of testing: unit tests, edge case handling, error states, or a documented test plan.
Deployment & Documentation	Is it live and accessible? Is the README clear enough for a stranger to understand and run the project?

We are not looking for the most technically complex submission. We are looking for the submission that shows the clearest thinking, the most deliberate product decisions, and the most reliable execution within the time available.

6. Rules & Guidelines

What is Allowed

- Any programming language, framework, or library
- Open-source tools, templates, and starter kits, with attribution in your README
- AI coding assistants (Copilot, Cursor, Claude, etc.), but you must understand and be able to explain every part of your code
- Free-tier cloud services for hosting, databases, and APIs

What is Not Allowed

- Submitting work that is not your own. Plagiarism results in immediate disqualification
- Copying another candidate's submission
- Submitting a design mockup, slide deck, or non-functional prototype in place of a working product

A Note on AI Tools

You may use AI coding assistants. However, during any follow-up interview, you will be asked to walk through your code and explain your decisions. If you cannot explain what your code does or why certain choices were made, it will be apparent.

7. Timeline & Submission

Submission deadline: 26th Oct, 11 AM IST

Note: Late submissions will not be accepted.

If you have any questions, reach out to Swati at [redacted]

We look forward to seeing what you build. Good luck.
